Objective: I know how to solve 2-step equations. In the equation $3x - 2 = 16$, notice that the variable is being multiplied and has a term being subtracted. To isolate the variable, we need to add 2 to both sides and then divide both sides by 3. Look at the lesson on Solving Two-Step Equations if you need help on how to solve two-step equations.

Two-Step Equations Practice Problems with Answers - ChiliMath
Two step math equations are algebraic problems that require you to make two moves to find the value of the unknown variable. For example, using the equation $3x + 5 = 11$ we will need to perform two steps to find the value of x . The first step would be to get the constant values of the equation by themselves. In this case 5 and 11 are our constants.

Two-step equations. The main difference between one-step equations and two-step equations is that one more step you need to do in order to solve a two-step equation. That additional step may be something like multiplying the variable by a certain number to get rid of a fraction in front of it. Otherwise, the rules are the same as before and these equations are just as easy to learn and solve as are the one-step ones.
